

**Amendments to the Claims:**

This listing of claims will replace all prior versions and listings of claims in the application:

1           1.     (Original)   A method for controlling a gap in an electrically  
2     conducting solid state structure, comprising the steps of:  
3           providing an electrically conducting solid state structure including a  
4     gap in the structure;  
5           exposing the structure to a fabrication process environment conditions  
6     of which are selected to alter an extent of the gap in the structure;  
7           applying a voltage bias across the gap in the structure during process  
8     environment exposure of the structure;  
9           measuring electron tunneling current across the gap during process  
10    environment exposure of the structure; and  
11          controlling the process environment during process environment  
12    exposure of the structure based on tunneling current measurement.

1           2.     (Original)   The method of claim 1 wherein controlling the  
2     process environment comprises halting process environment exposure of the  
3     structure based on tunneling current measurement.

1           3.     (Original)   The method of claim 1 wherein controlling the  
2     process environment comprises comparing tunneling current measurement

3 with a threshold tunneling current corresponding to a prespecified gap extent  
4 and controlling the process environment based on the comparison.

1 4. (Original) The method of claim 1 wherein the conditions of the  
2 fabrication process environment are selected to increase an extent of the gap  
3 in the structure.

1 5. (Original) The method of claim 1 wherein the conditions of the  
2 fabrication process environment are selected to decrease an extent of the gap  
3 in the structure.

1 6. (Original) The method of claim 1 wherein the fabrication  
2 process environment comprises ion beam exposure of the structure.

1 7. (Original) The method of claim 6 wherein the ion beam  
2 exposure comprises blanket ion beam exposure of the structure.

1 8. (Original) The method of claim 6 wherein the ion beam  
2 exposure comprises rastering of the structure by a focused ion beam.

1 9. (Original) The method of claim 1 wherein the structure  
2 comprises two electrically conducting electrodes having a gap between the  
3 electrodes.

1 10. (Original) The method of claim 9 wherein the electrically  
2 conducting electrodes are disposed on an electrically insulating membrane  
3 including an aperture aligned with the gap between the electrodes.

1           11.   (Original)   The method of claim 9 wherein the electrically  
2   conducting electrodes are disposed on an electrically insulating surface of a  
3   substrate.

1           12.   (Original)   A method for controlling a gap between electrically  
2   conducting electrodes, comprising the steps of:  
3           providing at least two electrodes on a support structure, each electrode  
4   having an electrode tip that is separated from other electrode tips by a gap;  
5   and  
6           exposing the electrodes to a flux of ions causing transport of material  
7   of the electrodes to corresponding electrode tips, locally adding material of  
8   the electrodes to electrode tips in the gap.

1           13.   (Original)   The method of claim 12 wherein the support  
2   structure comprises a substrate

1           14.   (Original)   The method of claim 13 wherein the substrate  
2   comprises an electrically insulating surface on which the electrodes are  
3   disposed.

1           15.   (Original)   The method of claim 12 wherein the support  
2   structure comprises a membrane including an aperture aligned with the  
3   electrode gap.

1           16.   (Original)   The method of claim 12 wherein the support  
2   structure comprises a substrate including a trench aligned with the electrode  
3   gap.

1           17.   (Original)   The method of claim 12 wherein the electrodes  
2           comprise metal electrodes.

1           18.   (Original)   The method of claim 12 wherein the ion flux  
2           exposure of the electrodes comprises blanket ion beam exposure of the  
3           electrodes.

1           19.   (Original)   The method of claim 12 wherein the ion beam  
2           exposure of the electrodes comprises rastering of the electrodes by a focused  
3           ion beam.

1           20.   (Original)   The method of claim 12 further comprising:  
2           applying a voltage bias across the gap between electrodes during ion  
3           flux exposure of the electrodes;  
4           measuring an electron tunneling current across the gap, between  
5           electrodes, during ion flux exposure of the electrodes; and  
6           controlling the ion flux exposure of the electrodes during ion flux  
7           exposure of the electrodes based on tunneling current measurement.

1           21.   (Original)   The method of claim 20 wherein control of the ion flux  
2           exposure of the electrodes comprises halting of the ion flux exposure.

1           22.   (New) The method of claim 1 wherein the fabrication process  
2           environment comprises electron beam exposure of the structure.

1           23.   (New) The method of claim 9 wherein each electrically conducting  
2           electrode is connected in a closed-loop circuit across the gap for measuring  
3           electron tunneling across the gap.

1           24.   (New) The method of claim 9 wherein each electrically conducting  
2 electrode is disposed in a connection to an electrical contact pad.

1           25.   (New) The method of claim 24 wherein applying a voltage bias  
2 across the gap in the structure comprises applying a voltage bias between the  
3 electrical contact pads.

1           26.   (New) The method of claim 1 wherein providing an electrically  
2 conducting solid state structure including a gap in the structure comprises:  
3           first providing an electrically conducting solid state structure without a  
4 gap; and  
5           initiating the fabrication process environment to provide a gap in the solid  
6 state structure.

1           27.   (New) The method of claim 1 wherein providing an electrically  
2 conducting solid state structure including a gap in the structure comprises:  
3           first providing an electrically conducting solid state structure without a  
4 gap; and  
5           initiating a fabrication process environment to provide a gap in the solid  
6 state structure that defines two electrically conducting electrodes separated from  
7 each other by the gap.

1           28.   (New) The method of claim 27 wherein the exposure of the structure  
2 to fabrication process environment increases the extent of the gap between the  
3 two electrically conducting electrodes.

1           29.   (New) The method of claim 10 wherein the electrically insulating  
2 membrane comprises a silicon nitride membrane.

1           30.   (New) The method of claim 11 wherein the substrate comprises a  
2 silicon substrate.

1           31.   (New) The method of claim 1 wherein measuring electron tunneling  
2 current comprises amplifying acquired electron tunneling current prior to  
3 measuring electron tunneling current.

1           32.   (New) The method of claim 1 wherein measuring electron tunneling  
2 current comprises digitizing acquired electron tunneling current prior to  
3 measuring electron tunneling current.

1           33.   (New) The method of claim 1 wherein applying a voltage bias across  
2 the gap comprises applying across the gap a voltage that is less than a work  
3 function that is characteristic of the electrically conducting solid state structure.

1           34.   (New) The method of claim 1 wherein controlling the process  
2 environment based on tunneling current measurement comprises:  
3           determining the gap,  $g$ , as a function of measured tunneling current,  $I$ , and  
4 applied voltage bias,  $V$ , as:

5 
$$I(V) = aV^2 e^{-b/V}$$

6 where 
$$a = \frac{\sigma e^3}{16\pi^2 \phi \hbar g^2} \quad \text{and} \quad b = \frac{4(2m_e)^{1/2} \phi^{3/2} g}{3\hbar e}$$

7 and where  $\sigma$  is an area of the solid state structure at opposite sides of the gap,  $e$   
8 is the elementary charge,  $1.6 \times 10^{-19}$  C;  $\hbar = 1.1 \times 10^{-34}$  J·s;  $m_e = 9.1 \times 10^{-31}$  Kg; and  
9  $\phi$  is a work function of the solid state structure at the gap; and

10           controlling the process environment based on the determined gap.

1           35.   (New) The method of claim 1 wherein controlling the process  
2 environment based on tunneling current measurement comprises:  
3           determining the gap,  $g$ , as a function of measured tunneling current,  $I$ , and  
4 applied voltage bias,  $V$ , as:

$$I(V) = I_0 e^{-\alpha \sqrt{\phi} g}$$

5  
6   where            $I_0 = \frac{\sigma e^2}{4\pi^2 \hbar^2} \frac{\sqrt{2m_e \phi}}{g} V$            and            $\alpha = \frac{2\sqrt{2m_e}}{\hbar}$

7   and where  $\sigma$  is an area of the solid state structure at opposite sides of the gap,  $e$   
8 is the elementary charge,  $1.6 \times 10^{-19}$  C;  $\hbar = 1.1 \times 10^{-34}$  J·s;  $m_e = 9.1 \times 10^{-31}$  Kg; and  
9  $\phi$  is a work function of the solid state structure at the gap; and

10           controlling the process environment based on the determined gap.
